

# Real-Time, Remote Industrial Engine Monitoring

When every hour of missed production means thousands of dollars lost...nothing impacts your bottom line like downtime.

With Monico's simple but powerful solution, The CDL Gateway™ PLUS, industrial engine downtime can be a thing of the past:

- Monitor your engines – so you can provide emergency maintenance before a major shut down
- Know when there's trouble – when trouble signs occur, get real-time notification via text or email
- Get back up and running fast – if a failure does occur, immediately pinpoint the problem from detailed data logs and fault codes

The CDL Gateway™ PLUS polls your engine's vital signs at a rate of 20 to 60 parameters per second, so it can quickly tell you if your engine is running up to par. And it supports over a hundred different protocols, so you can rest assured your data will be readily accessible. Best of all, no intermediate devices are needed and little or no setup is required.

## About the CDL Gateway™ PLUS

The Monico CDL Gateway™ PLUS is a "Plug & Play" protocol converter/data concentrator product, which provides direct access to engine monitoring parameters from Caterpillar® industrial equipment via a variety of different protocols. It is used in applications where engine data needs to be accessed from a PLC, a Human-Machine Interface (HMI), building management system, SCADA System or some other remote monitoring device.

For more information or a complimentary tour of how the CDL Gateway™ PLUS can keep your engines running longer and more efficiently, visit our website, [www.monicoinc.com](http://www.monicoinc.com) or contact us at [sales@monicoinc.com](mailto:sales@monicoinc.com).
